Design tools Multi-User (MUL) The MUL (Multi-User) version is a version of AutoCAD available for purchase from AutoDesk. MUL allows multiple users to work on a single drawing file. It is designed for teams, with each user working on their own sub-area of the drawing while it is open. This enables different people to work on different areas of a drawing at the same time, while still having full access to all areas. Multi-User (MUL) is available in two versions: one licensed for home and business use, and a second version for large organizations (corporate, educational, governmental and military). It is available as both a subscription-based and perpetual license. There are two levels of subscription-based MUL, depending on the number of users: "Light" MUL is available in both home and business versions. There is no limit to the number of users, and the cost is US\$5000 for the year for a single user. "Pro" MUL is available for "heavy" users, either in the home or business versions. It is restricted to 100 users and the cost is US\$3000 per user for the year. MUL operates on single license-based desktops and laptops. To use MUL, the computer must have two graphics cards, one for MUL and the other for the AutoCAD application. Each user requires an.RXA file for the drawing on which they are working. To use MUL, a desktop must be running Windows 10. Collaborative design Collaborative design (CD) is a more recent software tool from AutoDesk, which allows multiple designers to work on a single drawing at the same time. CD can be used for 1:1 or multi-user drawing. CD is available in two versions: One-to-one: CD is available in both desktop and web versions. Only one user can work on a single drawing at a time, and each user needs their own AutoCAD license. The cost is US\$399/user for the one-to-one desktop version, US\$1599/user for the one-to-one web version, and US\$1599 for a one-to-one web license with access to the CD Desktop version. Multi-user: CD is available for multi-user in both desktop and web versions. The cost is US\$599/user for the 5b5f913d15

Nonwoven fabrics, or "lattices", are increasingly used in a wide variety of industrial and consumer products. They are often produced by extrusion, but may also be produced by other processes, such as those described in U.S. Pat. Nos. 3,929,450 and 3,033,753, as well as EP 0 067 067, EP 0 244 899, and EP 0 696 033. Regardless of the particular method of manufacture, these fabrics generally have more than one fiber orientation, and are thus more than a simple unidirectional or two-dimensional fabric. For many industrial and consumer applications, it is important for the nonwoven fabrics to have a porous or open structure. That is, the fabric should be permeable to air and liquids. One example of an application where this is important is the production of disposable hygienic products, such as diapers, adult incontinence products, and feminine hygiene products. For these products, it is desirable to have a breathable fabric that allows moisture to pass through the product to the exterior, while preventing the ingress of dirt and germs. Another example of an industrial application where it is desirable for the nonwoven fabric to be permeable is in the production of filtration and separation materials, such as those used in the pharmaceutical, food, and beverage industries. This application requires that the fabric be able to filter certain particles from liquids, while allowing other particles to pass
