Shut IT is a lightweight, yet useful tool that provides you with a simple way to schedule power-related commands. It provides support for all the power management functions, including shutdown, reboot, log off, standby or hibernate. Automatic or manual operation configuration There are two different timing modes that you can use. A task can be performed by the system either at a user-defined time in the future or after a specific time interval from the present moment. The first option means that you can instruct the application to action a power down job at a definite time (within a time interval of 24 hours, since date scheduling is not available), whereas the latter enables you to specify a time limit, allowing the application to countdown to the execution time. Once the configuration

process is finished, the application automatically switches to 'mini' mode, displaying a small window that includes the amount of time left until the execution, along with the job name, while also offering you the possibility to run the task on the spot or abort the whole operation immediately.

Faster computer shutdown You can keep this tiny panel on your desktop to keep an eye on the timer and adjust its transparency, so that it doesn't bother you while working. Alternatively, the application can be closed (in this case, the task is canceled) using the new system tray icon. The functions of Shut IT are not limited to this. A set of additional actions can be performed, right before the power-down event occurs and tweaks can be applied for faster future computer shutdown (setting the hung and kill applications timeout and the time allocated to terminating unresponsive services).
