If you start to feel that you're becoming a slave to the Channels palette, you better start looking for a new job, because you're definitely at the point when you should consider looking for a new job. The biggest change in version 23 is the new Layer Masks feature. It basically turns the Channels palette into a filter stack. Just select the Layers palette and choose Layer Masks from the Edit menu. Once you've selected a mask, you can use it in a variety of ways. Like before, you can use it to reveal or reveal as well as hide or hide Layers. You can also use a layer mask to create a duplicate of an existing layer. When creating a duplicate, if you need to, you can adjust the opacity of the layer mask instead of the actual layer. And single-handedly, you can create a selection mask, which is important for many things, including stroke and color adjustment. You can also use a layer mask to apply a completely different look to a layer, in effect creating a plug-in for an existing action. You can even use Layer Masks as a filter over other layer masks. The Enable Reverse Displacement option allows you to easily add displacement to an object. The feature is located in the Displacement panel, also called the Invert Displacement panel of before. All you do is click on the edge of an object and drag, and you'll add a displacement to that edge. One of Lightroom's great strengths is its ability to import and manage several different file types. Lightroom can reduce confusion and frustration by cleaning up all your images and displaying them in such a way that you can easily work on them. Another great feature (if you're not a RAW (CRW) photographer), is the ability to open files with different RAW formats and change them to another format once you have the file on a computer where it can be processed.
