What you can do with Photoshop is virtually endless. Of course, you won't get Photoshop CC's specially optimized hardware for pipeline and compression, but it does see all the way back to

Photoshop 6. Even at that, you can get better compression than what's incorporated into Photoshop 7. You can create floating palettes, scroll through layers as a fan, and even have a window on the side of the screen. You can use the Expert Collections function so that you can apply many editing tricks in one step. You can even do a Color Curves adjustment that's personalized for you. You can extract the best parts of Photosynth to create one very graphic image, and render graphics into a collage that you can use on cards to sell at gigs. You can export Visio diagrams, and create 3D designs for use in Flash. As excellent as Photoshop is, though, you probably already have Photoshop on your system. The one potential issue with it is that it's ever-growing. Adobe also recently put up a paywall for Photoshop; I prefer to use the free **GIMP** version instead. For the most part, I'm happy with Photoshop, but it's not perfect. It can be annoying to open, particularly since it's downloaded a ton of graphics for a lot of scripts and libraries on the start up. If you are a big section editor, though, you have little to worry about. I say this as someone who types almost 180 words per minute. I'm using the 64 bit version of Photoshop, and I'm running on a Core i7 2.8 GHz box with 16 GB of RAM, and 1920 x 1080 screen.

People can also flatten, use, and print from Photoshop's RAW file. In layman's term, these are the eligible images that are saved in the raw format, as they have more flexibility and more control.
