As posted on Creativity Online , the new features in Lightroom 5 are similar to the new Photoshop Elements CS6. However, at my first look at the Lightroom 5 user interface, I found it slightly more similar to the interface of Lightroom 4 than to that of Photoshop Elements. It makes sense that Lightroom 5 requires a lot more RAM as it has a number of more features. Performance wise, it should be faster than Lightroom 4 though, at least in the current build. I have no issue editing 32 GB's of RAW files either in Photoshop or Lightroom 5 without problems. Specifically what I like about the new Lightroom 5 is that a lot of the initial editing in the program happens in the left browser panel. In the future, there will be more panels cropping up. However, it will also make testing your work easier. You can more frequently switch back to the main panel and view your work since the large browser window is scrolled off the right side of the job canvas.
